Linked Data

Recommended best practice for exposing, sharing, and connecting pieces of data, information, and knowledge ***on the web.***

Standard format ...

Reachable ...

Relationships between data ...

Collection of interrelated data → Linked Data

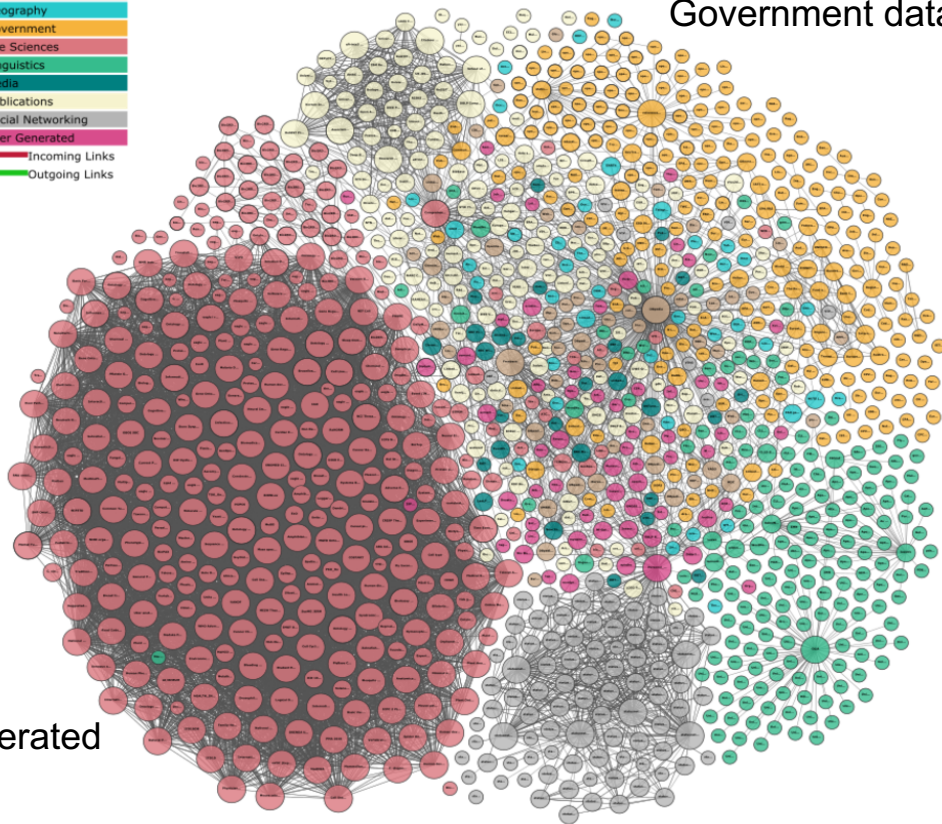

Key concept: Give each *thing* in the data an individual identity or URI

Last updated: 2017-08-22

Publications

Government data

Geo

User generated

32 billion triples in 2014

...

192 billion+ triples in 2017

See <http://stats.lod2.eu/stats>

Can we plug netCDF/HDF data in?

Other motivations

Encode and interpret nc files that use multiple metadata standards/conventions effectively (e.g. check naming and codelist conflicts) - CF often combined with other conventions (e.g. ACDD + CF)

Exploit Web and Linked Data tech to **enhance discovery** across large collections of files (e.g. represent separate files as graphs)

Represent nc/hdf files as close to the spirit of a binary array data model (vs. transform into other data models like RDF Data Cube (yet))

People are **already** linking to external references but not consistently ...

Design principles

Work with current netCDF files

Design a simple mechanism to that works with existing netCDF files as-is to encode in a Linked Data friendly format.

Allow consistent and precise naming of each *thing* in netCDF/HDF metadata

Implies introducing new syntax (compatible with netCDF / HDF) to build URIs for each attribute name and property value

Enable consistent way to link to references, e.g. model, instrument, etc.

Overview

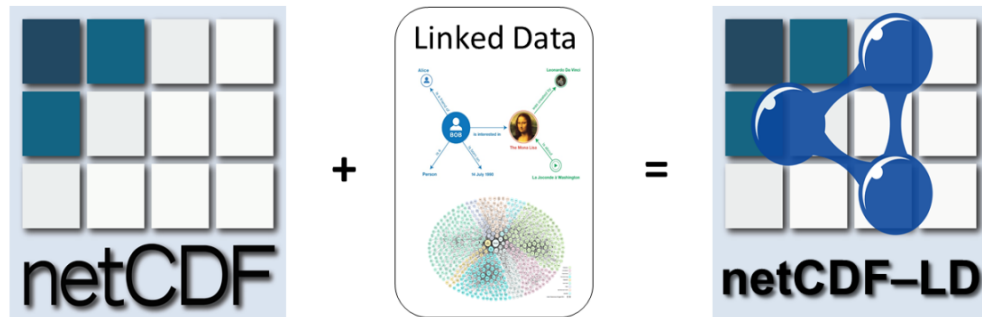

What have we been up to?

Tools

Syntax (aliasing, prefixes)

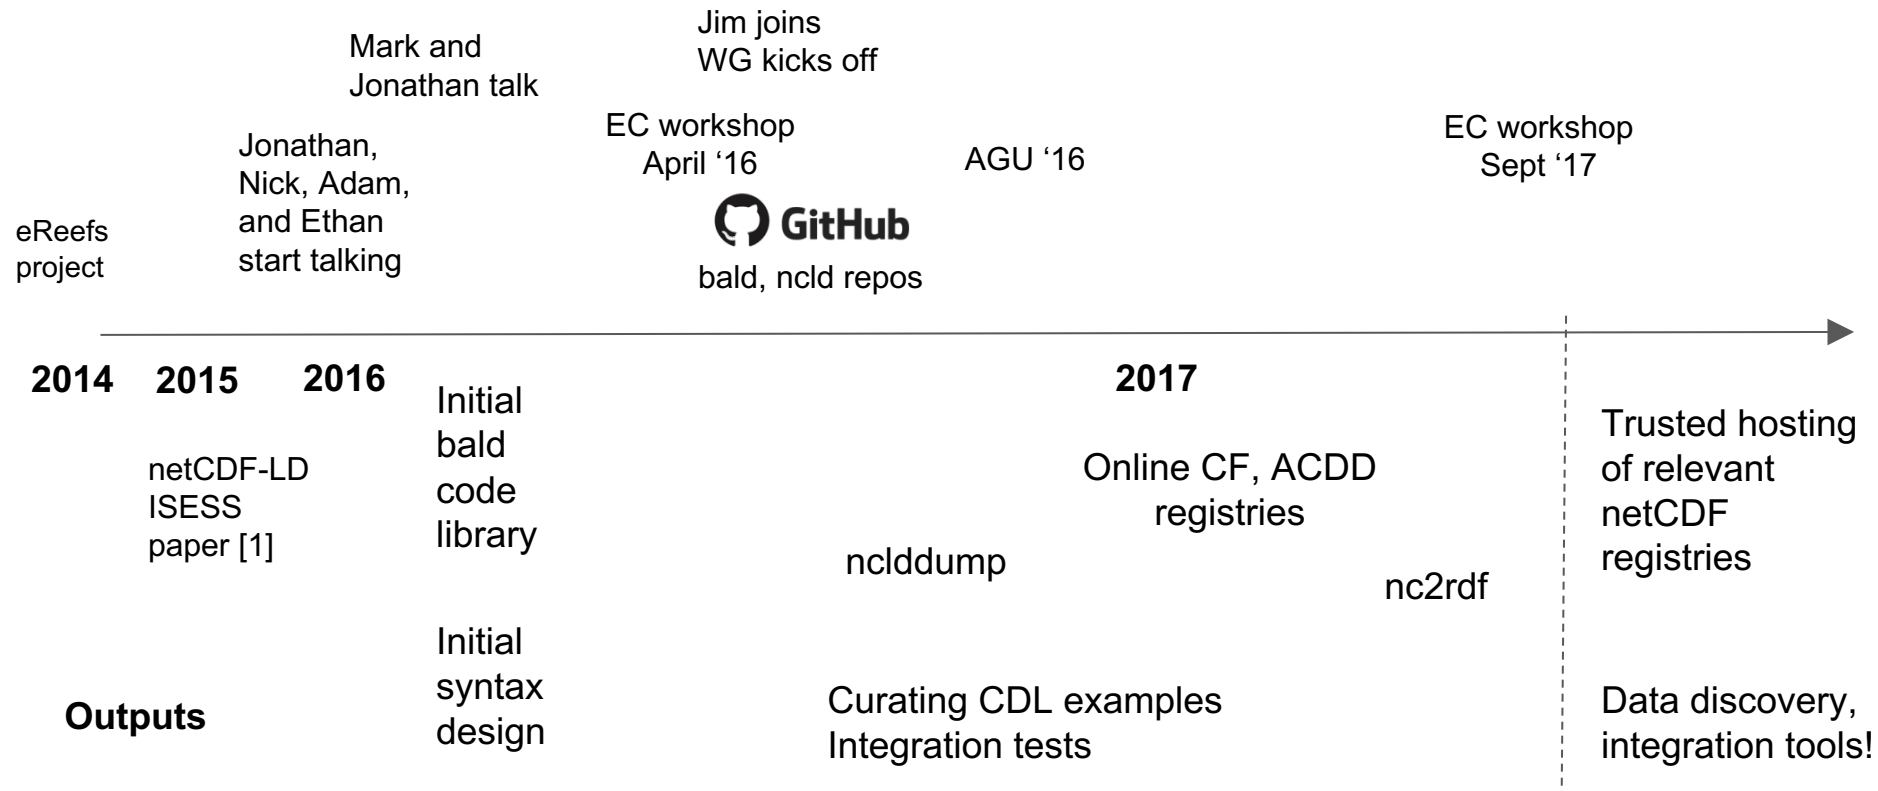

Supporting registries

Next steps

What have we been up to?

Events

[1] Yu et al. 2015, Towards Linked Data Conventions for Delivery of Environmental Data Using netCDF, https://doi.org/10.1007/978-3-319-15994-2_9

Tools

Python libraries (Github bald repo) - (bald = binary array linked data)

<https://github.com/binary-array-ld/bald>

Command line tools (in development):

ncldump

nc2rdf

Demos

nclddmp

```
$ python nclddmp.py example.cdl
```

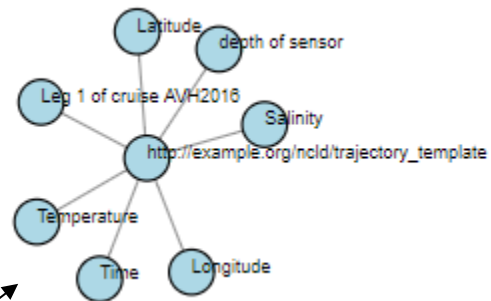

Example on <https://binary-array-ld.github.io/netcdf-ld/>

nc2rdf

```
$ python nc2rdf.py example.cdl
```

(visualisation representation)

Load into
triple store DB
for semantic queries

ereefs convention example

variables:

```
float eta(time, j, i) ;  
    eta:units = "metre" ;  
    eta:long_name = "Surface elevation" ;  
    eta:standard_name = "sea_surface_height_above_sea_level" ;  
    eta:medium_id = "ocean"  
    eta:scaledQuantityKind_id = "sea_surface_elevation"  
    eta:substanceOrTaxon_id = "ocean_near_surface"
```

ereefs convention example - what we wanted

variables:

```
float eta(time, j, i) ;  
    eta:units = "metre" ;  
    eta:long_name = "Surface elevation" ;  
    eta:standard_name = "sea_surface_height_above_sea_level" ;  
    eta:medium_id = "ocean"  
    eta:scaledQuantityKind_id = "sea_surface_elevation"  
    eta:substanceOrTaxon_id = "ocean_near_surface"
```

Who defines
these terms?

How do I check
validity?

ereefs convention example - what we ended up with

variables:

```
float eta(time, j, i) ;  
    eta:units = "metre" ;  
    eta:long_name = "Surface elevation" ;  
    eta:standard_name = "sea_surface_height_above_sea_level" ;  
    eta:medium_id = "http://environment.data.gov.au/def/feature/ocean" ;  
    eta:scaledQuantityKind_id =  
        "http://environment.data.gov.au/def/property/sea\_surface\_elevation" ;  
    eta:substanceOrTaxon_id =  
        "http://environment.data.gov.au/def/feature/ocean\_near\_surface" ;
```

I can check validity over the web (HTTP)

Not very scalable or extensible :(
Also not that readable...

Binary Array LD Syntax (for netCDF and HDF)

Methods to encode or process nc/hdf for translating to RDF / Linked Data ready

Aliasing

Lookup table for 'well-known' or declared mappings

Can be explicit or implicit

Pros: Easy to convert current nc files

Cons: Resolving clashes

e.g. `title` → `acdd:title`

(netcdf)

(RDF)

Prefixing

Kinda like namespacing

Pros: Easy to convert conformant files

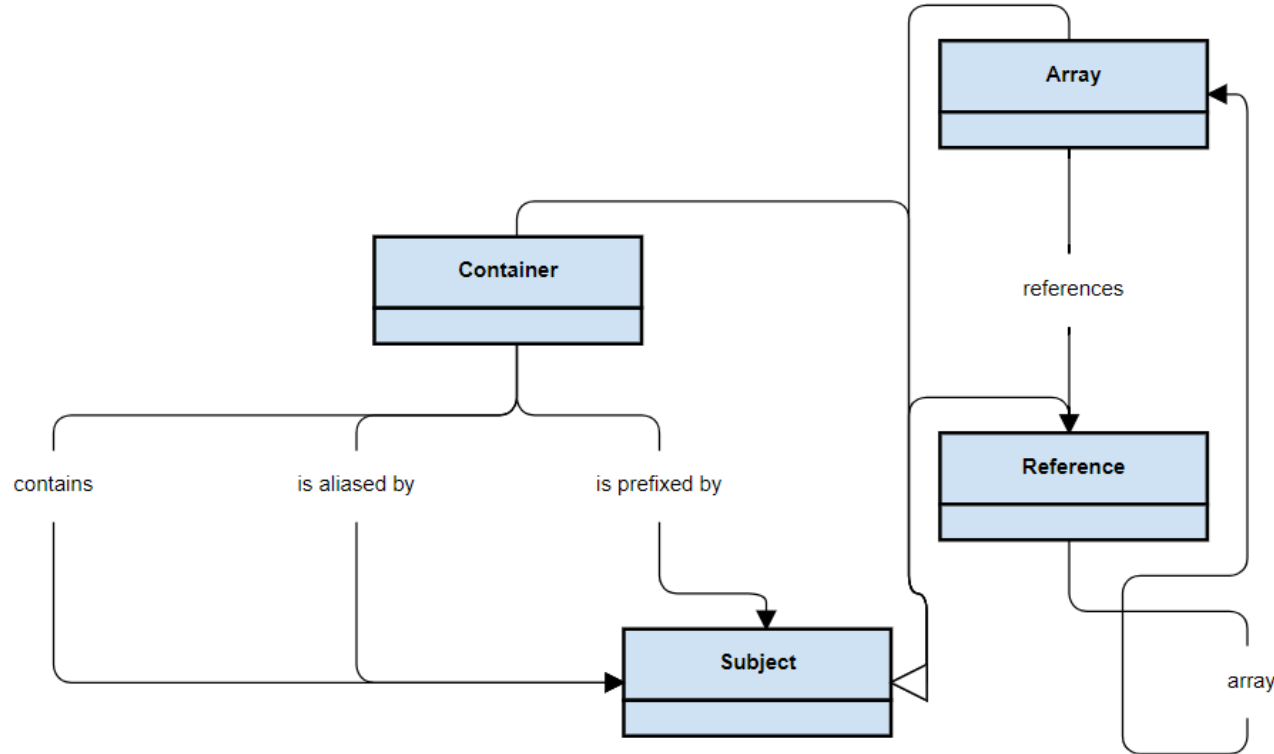

Cons: Current files need tweaking

e.g. `acdd__title` → `acdd:title`

(netcdf)

(RDF)

Binary Array Linked Data (BALD) model

<http://binary-array-id.net/latest?classView=true>

Aliasing example

variables:

```
int variable(pdimm0, pdimm1) ;  
    variable:SDN_ParameterDiscoveryCode = "BactTaxaAbundSed" ;
```

```
int cfvariable(pdimm0, pdimm1) ;  
    cfvariable:standard_name = "air_temperature" ;
```

```
// global attributes:  
    :isAliasedBy = "alias_list" ;
```

Variable metadata

Aliasing example – adding context (explicit aliases)

variables:

```
int alias_list ;  
    alias_list:SDN_ParameterDiscoveryCode =  
"http://vocab.nerc.ac.uk/isoCodelists/sdnCodelists/cdicrCodeList.xml#SDN\_ParameterDiscoveryCode" ;  
    alias_list:BactTaxaAbundSed = "http://vocab.nerc.ac.uk/collection/P02/current/BAUC/" ;  
    alias_list:standard_name = "https://def.scitools.org.uk/CFTerms/standard\_name" ;  
    alias_list:air_temperature = "http://vocab.nerc.ac.uk/collection/P07/current/CFSN0023/" ;  
  
int variable(pdimm0, pdimm1) ;  
    variable:SDN_ParameterDiscoveryCode = "BactTaxaAbundSed" ;  
  
int cfvariable(pdimm0, pdimm1) ;  
    cfvariable:standard_name = "air_temperature" ;  
  
// global attributes:  
    :isAliasedBy = "alias_list" ;
```

Mappings

Variable metadata

Aliasing example – RDF representation

```
<example> a bald:Container ;  
  bald:contains <variable>, <cfvariable> .
```

...

```
<variable> a bald:Array ;
```

```
  ns1:SDN_ParameterDiscoveryCode
```

```
  <http://vocab.nerc.ac.uk/collection/P02/current/BAUC/> ;
```

```
<cfvariable> a bald:Array ;
```

```
  ns2:standard_name
```

```
  <http://vocab.nerc.ac.uk/collection/P07/current/CFSN0023/> .
```

Prefix example – ereefs running example

variables:

```
float eta(time, j, i) ;  
    eta:units = "metre" ;  
    eta:long_name = "Surface elevation" ;  
    eta:standard_name = "sea_surface_height_above_sea_level" ;  
    eta:medium_id = "ocean"  
    eta:scaledQuantityKind_id = "sea_surface_elevation"  
    eta:substanceOrTaxon_id = "ocean_near_surface"
```

Variable metadata

Prefix example – ereefs with prefixes added

variables:

```
float eta(time, j, i) ;  
    eta:units = "metre" ;  
    eta:cf__long_name = "Surface elevation" ;  
    eta:cf__standard_name = "cfsn__sea_surface_height_above_sea_level" ;  
    eta:ereefs_medium_id = "feature__ocean"  
    eta:ereefs_scaledQuantityKind_id = "property__sea_surface_elevation"  
    eta:ereefs_substanceOrTaxon_id = "feature__ocean_near_surface"
```

Variable metadata

Prefix example – added prefix mappings

variables:

```
int prefix_list;  
    prefix_list:cf__ = https://def.scitools.org.uk/CFTerms/  
    prefix_list:cfsn__ = http://mmisw.org/ont/cf/parameter/  
    prefix_list:feature__ = "http://environment.data.gov.au/def/feature/" ;  
    prefix_list:property__ = "http://environment.data.gov.au/def/property/" ;  
    prefix_list:ereefs__ = "http://registry.it.csiro.au/sandbox/ncl/ereefs-attributes/" ;
```

Prefix Mappings

```
float eta(time, j, i) ;  
    eta:units = "metre" ;  
    eta:cf\_long\_name = "Surface elevation" ;  
    eta:cf\_standard\_name = "cfsn\_sea\_surface\_height\_above\_sea\_level" ;  
    eta:ereefs\_medium\_id = "feature\_ocean"  
    eta:ereefs\_scaledQuantityKind\_id = "property\_sea\_surface\_elevation"  
    eta:ereefs\_substanceOrTaxon\_id = "feature\_ocean\_near\_surface"
```

Variable metadata

Demo visualisations of graphs from CDL examples in bald repo

nclid example 1 :: BALD Containers and Arrays

Developed by [Epimorphics Ltd](#)

<https://def.scitools.org.uk/>

Next steps

Establishing trusted registers online - CF terms, NUG, ACDD

Process THREDDS servers and explore integration and visualisations

Explore opportunities to link to other codelists

- Area type <http://vocab.nerc.ac.uk/collection/P30/current>
- Standardised regions (P29) <http://vocab.nerc.ac.uk/collection/P29/current/>

Build tools and demonstrators showing discovery across existing netCDF CF repositories (e.g. via THREDDS)

Want to contribute? Submit nc samples to the bald repo

Thanks
